

Chompy — Quick Start

Kids' meal logging · Snap their meals. Know their nutrition.

Set up Chompy on iPhone

Chompy is a web app (PWA) — no App Store needed. You install it straight from Safari.

1. **Open Safari** (must be Safari, not Chrome) and go to <https://chompy-pwa.ak-projects.workers.dev>
2. Tap the **Share** button (the square with an up-arrow).
3. Scroll down and tap **Add to Home Screen** → **Add**.
4. Launch **Chompy** from your home screen — it opens full-screen like a native app.
5. **Sign in:** enter your **phone number**, then tap send — you'll be asked for a 6-digit code.
6. **Default OTP:** **123456** — this master code works for *any* phone number (SMS isn't wired up yet). Enter it to log in.
7. First time only: fill in the child's **profile** (name, age, etc.) so nutrition targets are personalized. You're in.

Allow **notifications** if you want meal reminders. Updates are automatic (it's a PWA) — no reinstalling. The code

123456 is a shared dev password: anyone with it can sign into any number, so don't post the link + code publicly.

Chompy — ChatGPT Integration

Read-only access to the food log via MCP + OAuth

Connect Chompy to ChatGPT

Chompy runs a read-only MCP server, so ChatGPT can search and read your child's food log — view-only, no writes.

1. In **ChatGPT**, open **Settings** → **Connectors**. (Requires a plan/mode that allows **custom connectors** — Pro, Business/Enterprise, or Developer mode.)
2. **Add a custom connector** and enter the MCP URL:
<https://chompy-pwa.ak-projects.workers.dev/mcp>
3. ChatGPT auto-discovers the OAuth server and opens a **login page**.
4. Enter your **phone number**, then the OTP. **Default OTP:** **1 2 3 4 5 6** (same master code as the app).
5. **Authorize** — the connector links to that family's log.
6. In a chat (or Deep Research), enable the **Chompy** connector and ask e.g. *"What did my child eat today?"* or *"Which nutrients are low this week?"*

What it can read: profile, meals, meal photos, daily/weekly nutrition summaries, and dinner recommendations. There are **no write tools** — ChatGPT can't log or change anything. The same `/mcp` URL + OTP also works in other MCP clients (e.g. Claude Desktop).

Security note (dev state): this MCP endpoint is public and auto-discoverable, and the **1 2 3 4 5 6** master OTP verifies *any* phone — so anyone who reaches it could mint a read token to a family's whole log & photos. Fine for testing; lock it down (real SMS, token revocation, rate limiting) before real users.
